

Case Study: The "Food Good" Mobile Initiative

Instructions: Read the following case study carefully and answer all the questions provided below.

In Colombo, many restaurants and supermarkets in areas like Wellawatte and Bambalapitiya throw away large amounts of food every day, even though the food is still safe to eat. For example, Keells Super and other supermarkets often discard bakery products and prepared food items that are still safe for consumption. At the same time, many low-income families, university students, and homeless people struggle to find food at affordable prices. This highlights the importance of implementing structured food redistribution mechanisms to reduce waste and improve social welfare.

Nimal, as an entrepreneur, identified this social problem as a business opportunity and decided to create and launched mobile application called "Food Good" to reduce food waste by connecting people with nearby restaurants, supermarkets, and cafés. This app will be useful for these businesses because, instead of discarding their products, they can sell them, and people can buy food from nearby locations at affordable prices. For example, in Godagama, Mr. Kottu Restaurant discards approximately 10 kg of kottu food every night. The manager of this outlet decided to sell 1 kg of kottu for 150 LKR through the app.

- i) What social problem is highlighted in the paragraph
- ii) According to the text, how was this problem transformed into a business idea, and what are the possible ways this app could generate income?
- iii) Why is conducting a feasibility study considered crucial before starting a business or project
- iv) Identify and briefly explain the different types of feasibility studies
- v) After one year of launching the app, many users installed it, but they experienced difficulties logging in and completing online transactions. Which areas should Nimal immediately validate in the feasibility study to improve the app's usability and functionality?
- vi) What types of risks could Nimal face when launching his app? Identify at least three different risks
